

Amphetamines and designer drugs

The term designer drug refers to chemicals that are synthesised with the intention to bypass drug legislations. This is usually done by modifying the molecular structure without losing the subjective effects one gets from the original drug. In the last decade there has been a massive increase in the amount of designer drugs sold via the internet.

Many of the chemicals fall under the various drug analogue legislations in certain countries, but most countries have no general analogue act or equivalent legislation. Novel compounds often fall outside of the law after only minor structural modifications.

The most important groups of designer drugs are amphetamine derivatives like MDMA and other Ecstasy compounds, phenylcyclidin, fentanyl derivatives, petidin derivatives and designer cannabinoids, also known as Spice-compounds (See our BMF 44-Spice).

Chiron proudly presents a wide range of reference materials of designer drugs.

We are continuously expanding our product range.

On the following pages you will find an overview of our current selection.
