Edition 2

CHIRON CHIRON CHIRON

The logo consists of three identical vertical red bars. Each bar has the word "CHIRON" written vertically in white, sans-serif capital letters. The bars are evenly spaced and aligned horizontally.

FLAME RETARDANTS

Flame retardants, such as polybrominated diphenyl ethers (PBDEs), are abundant in modern society - from clothing and carpets to couches and computers - they are added to a wide range of every day products in an attempt to reduce flammability or delay combustion. The name implies that they convey safety, but to the contrary they have been associated with numerous adverse and bio-accumulative health effects, including endocrine disruption, infertility, birth defects, lowered IQs, behavioral problems, and cancers. Ironically, when alight the toxic soup of burning chemicals and byproducts released, such as dioxins, furans and formaldehyde, can be more hazardous than the fire itself.

Additionally, flame retardants persist in the environment – in water and soil – build up in wildlife, enter the food chain and are now global persistent organic pollutants (POPs) of concern. Despite of the environmental and toxicological concerns, they are, and will for some time remain abundant in many consumer goods. Since disclosure of their use is unregulated many consumers remain unaware of their existence or the hazards they pose.

Halogenated flame retardants, and particularly the brominated ones, have been used for decades, but concerns about their health risk have only been raised since the 2000's. The number of commercial flame retardants has been rather limited, less than 100 in total. New flame retardants containing various phosphor-containing compounds have been introduced after the concerns arose around the halogenated forms. Also, flame retardants bonded to various inorganic, insoluble or polymeric organic entities have entered market during the past years.

Nomenclature used in this catalogue

The nomenclature and the various abbreviations used in the literature over the years have been rather confusing, and partly misleading. Therefore, a new and common nomenclature rule was proposed by Bergmann et al.¹ in 2012 and is applied here:

- FR: Flame retardants
- BFRs: Brominated flame retardants, including those containing bromine and chlorine or bromine and phosphorous or all three
- CFR: Chlorinated flame retardants, including those with chlorine and phosphorous
- PFR: Phosphorous containing flame retardant. Those also containing bromine or chlorine are listed under BFRs or CFRs, respectively.

Bergmann further proposed “Practical Abbreviations” (PRABS) to be used as the common abbreviated form of known FRs, and those are the ones in use to here.

The scope of this catalogue

All most common flame retardants are listed. Chiron offers both technical products (techn.), purified or specifically synthesized standards, with purity normally above 98 %. Mixtures according to international methods or customer requests are also available.

Please enquire for custom mixtures, custom synthesis or new compounds.

Internal standards

Chiron offer both deuterated standards and ¹³C labelled, as well as monofluorinated PBDEs, which were developed by Chiron AS*.

*The Chiron technology for producing monofluorinated PCBs and PBDEs is protected by US patent 8,481,327 B2 from July 9th, 2013.
