

PETROLEUM REFERENCE MATERIAL

PETROLEUM

Chiron was established in 1983 by Dr. Jon Eigill Johansen in Trondheim, Norway and started with the development and production of biomarkers for use in the search for oil in the North Sea. Chiron has therefore been involved in the preparation of steroid and triterpanoid (hopane) reference materials used in the petroleum industry for over 30 years, and possess a unique experience in this field. These compounds are found in petroleum and sediments. Hopanes are in fact the second largest group of natural products on earth, surpassed only by cellulose. This type of compound changes its chemical structure over time and maturation. They have traditionally been used in petroleum exploration, but in recent years have been increasingly used for forensic analysis, for example in the investigation of oil spills. Chiron works with major oil companies, institutions, private laboratories, universities and hospitals in this area, and is currently the only producer of a large range of oil exploration reference materials.
